

# PUBLISH THE WEBAPP

Now we are going to publish the React App to a URL so we can browse to the webapp using a public URL.

To publish the app, start by adding hosting to the Amplify project.

```
amplify add hosting
```

Choose `PROD (S3 with Cloudfront using HTTPS)` for hosting with [Amazon CloudFront](#) using HTTPS (recommended) and keep the defaults for the rest of the options.

Finally publish the app with the command

```
amplify publish
```

This will publishes the app to a live URL. You can then open the URL in any browser, VR or AR device!

You can try to open it with you mobile phone. You should see the login page. You can logon on your app by providing a new user, AWS Cognito will manage the entire subscription process with email verification.

## Note

We still missing the last part to make it work properly after the login part.
