

ADD PLAY BUTTON

Video autoplay may not be enabled on some browser's devices, for example on Safari on iOS. In such cases we suggest to add a user input (such as a touch, swipe or click).

In next steps we are going to add a `click button` in order to let the video play also on browser with autoplay blocking.

In next steps we are going to create a `state machine` in Amazon Sumerian responding to a VideoScript that will emit a message named **VideoAutoplayBlocked**, in order to manage this limit.

You will create a "play" button that will appear when this message is received, and send a PlayVideo message back to the `VideoScript` to attempt to play the video again.
