

CONFIGURE AMPLIFY AUTH COMPONENT

We are going to do that by leveraging on Amplify Authentication component that uses **Amazon Cognito**.

Configure the `Amplify Auth Component`.

```
amplify update auth
```

When prompted with `What do you want to do?`, choose

`Apply default configuration without Social Provider (Federation)` and then press **Enter** to use the default configuration.

This will create an **Amazon Cognito User Pool** for your app. As noted above, you can find the name of the user pool in `amplify/backend/amplify-meta.json` by searching for `UserPoolName` in the auth configuration section.

Update your cloud resources using the following Amplify command:

```
amplify push
```
