

# ADD USER AUTHENTICATION

---

The Amplify Xr Component created *Identity Pools* in **Amazon Cognito** as well as supporting authentication roles in the **AWS Identity and Access Management (IAM)** to support unauthenticated and authenticated users.

For your own information, you can see the resources Amplify provisioned for you.

For looking at an example you can have a look at the file **`amplify/backend/amplify-meta.json`**.

Now we will add authenticated access configuration to the React App using Amazon Cognito, so that the Sumerian scene can be accessed by registered users managed by an Amazon Cognito Users Pool.
