CREATE AWS AMPLIFY WEBAPP

In this section we are giong to create a webapp using **AWS Amplify**.

AWS Amplify is the fastest and easiest way to build mobile applications on AWS. Amplify allows you quickly set up authentication, analytics, and offline data sync for your mobile applications with a few commands and integrate them into your application with a few lines of code. You can find additional info here.

AWS Amplify recently added an XR category that has built-in support for **Amazon Sumerian**. Now, when you publish your Sumerian scene, you have the option to publish privately so that only authenticated users can access your scene.

In this workshop part we set up an Amplify React webapp to hold our Amazon Sumerian scene for authenticated users to access.
