REACT APP WITH AMPLIFY

The first thing to do is create a React app and add an Amplify project to it.

Create the React app by using **create-react-app** in the Cloud9 terminal window.

```
npx create-react-app sumerian-amplify-app
```

> ℹ Note

For more information about create-react-app, see this documentation.

Change to the React project, and then install the `aws-amplify` and `aws-amplify-react` libraries within the webapp project.

```
cd sumerian-amplify-app
npm install aws-amplify aws-amplify-react --save
```

> ℹ Note

After the install succeeds, you may see some warnings populate. It is safe to ignore them.
